

Lecture 9 Finding More Shapes

COMP3204 Computer Vision

How can we go from conic sections to general shapes?

Book

pp
254-259;
275-279

**Department of
Electronics and
Computer Science**

**UNIVERSITY OF
Southampton**
School of Electronics
and Computer Science

Content

1. What more versions of the Hough transform are possible?
2. What are its limits?
3. Can it be used to detect shapes that are not given by an equation?

Hough Transform for Circles

Again, it's **duality**: $(x - x_0)^2 + (y - y_0)^2 = r^2$

Points: x, y centre: x_0, y_0 radius: r

“ x_0, y_0 “ x, y “ r

Let's translate if into code

Pseudocode

```
accum=0
```

```
for all x,y
```

```
    if edge(y,x)>threshold
```

```
        for r=min_r, max_r
```

```
            for theta = 1,2*pi
```

```
                x0=x+r*cos(theta)
```

```
                y0=y+r*sin(theta)
```

```
                accum(y0, x0, r ) PLUS 1
```

```
y0, x0, r= argmax(accum)
```

!look at all points

!check significance

!do values of radius

!go around a circle

!generate x

!generate y

!vote in accumulator

!peak gives parameters

Circle Voting and Accumulator Space

Applying the HT for circles

image

(Sobel) edges

accumulator

small and large circles

Integrodifferential operator?

<https://stackoverflow.com/questions/27058057/comparing-irises-images-with-opencv>

Contact lenses

Extensions to conic sections

Ellipse

$$\frac{(x - x_0)^2}{a^2} + \frac{(y - y_0)^2}{b^2} = 1$$

Described by 4 parameters. If each has **100** values,

$$\text{accumulator size} = 10^2 \times 10^2 \times 10^2 \times 10^2 = 10^8 = 0.1\text{GB}$$

Add **rotation**, that's 10GB Ouch!

Motivates approaches to **save memory** and **improve speed** (since result is optimal)

Speeding it up.....

Now it's a **3D** accumulator, fast algorithms are available

E.g. by **differentiation**

Differentiating $(x - x_0)^2 + (y - y_0)^2 = r^2$ gives $\frac{dy}{dx} = -\frac{(x - x_0)}{(y - y_0)}$

Substitute back into Eqn. for circle

$$\left(\frac{dy}{dx}\right)^2 (y - y_0)^2 + (y - y_0)^2 = r^2 \quad \text{2D accumulator}$$

$$y - y_0 = \frac{r}{\sqrt{1 + \left(\frac{dy}{dx}\right)^2}}$$

This is the edge direction

Arbitrary Shapes

- Use Generalised HT
- Form (discrete) look-up-table (R-table)
- Vote via look-up-table

R-table Construction

$\hat{\phi}_i'$	$\gamma = (r, \alpha)$
0	$(r_0, \alpha_0), (r_1, \alpha_1), (r_2, \alpha_2)$
$\Delta\phi$	\vdots
$2\Delta\phi$	\vdots
...	...

R-table Construction

$\hat{\phi}_i$	$\gamma = (r, \alpha)$
0	$(r_0, \alpha_0), (r_1, \alpha_1), (r_2, \alpha_2)$
$\Delta\phi$	\vdots
$2\Delta\phi$	\vdots
...	...

Need to start somewhere

R-table Construction

$\hat{\phi}_i$	$\gamma = (r, \alpha)$
0	$(r_0, \alpha_0), (r_1, \alpha_1), (r_2, \alpha_2)$
$\Delta\phi$	\vdots
$2\Delta\phi$	\vdots
...	...

Measure edge direction

R-table Construction

$\hat{\phi}_i$	$\gamma = (r, \alpha)$
0	$(r_0, \alpha_0), (r_1, \alpha_1), (r_2, \alpha_2)$
$\Delta\phi$	\vdots
$2\Delta\phi$	\vdots
...	...

Determine length and direction to reference point

R-table Construction

$\hat{\phi}_i$	$\gamma = (r, \alpha)$
0	$(r_0, \alpha_0), (r_1, \alpha_1), (r_2, \alpha_2)$
$\Delta\phi$	\vdots
$2\Delta\phi$	\vdots
...	...

Store length and direction indexed by edge direction

R-table Construction

$\hat{\phi}_i$	$\gamma = (r, \alpha)$
0	$(r_0, \alpha_0), (r_1, \alpha_1), (r_2, \alpha_2)$
$\Delta\phi$	\vdots
$2\Delta\phi$	\vdots
...	...

Edge direction is not a unique
description
Gives noise in accumulator

Procedure for GHT

1. Determine centre of template shape
2. Form R-table from template shape
3. Use R-table to vote for points in the real image
For edge points $>$ threshold
Get edge direction(x,y)
For all R-table entries with direction(x,y)
Vote in accumulator (@distance, @direction)
4. Argmax(accumulator) gives centre co-ordinates of shape

Arbitrary Shapes

- Use Generalised HT
- Form (discrete) look-up-table (R-table)
- Vote via look-up-table
- Scale? scale R-table voting
- Orientation? Rotate R-table voting
- Inherent problems with discretisation

Visual inspection

Active Contours

- For **unknown** arbitrary shapes: extract by **evolution**
- **Elastic band** analogy
- **Balloon** analogy
- Discrete vs. continuous
- **Volcanoes?**

Geometric active contours

(a) initialisation

(b) result

Extraction by a Level-Set Based Approach

Parts-based shape modelling

(a) mechanical equivalent

(b) finding face features

Parts-based Shape Model

Symmetry

Takeaway time

- 1 – conic sections become more complex and take more time
 - 2 – can use Generalised Hough Transform for complex shapes
 - 3 – shape detection IS computer vision. Many more approaches
- Let's see how computer vision can work
